Question Paper Code

Corporate Office: Aakash Tower, 8, Pusa Road, New Delhi-110005 | Ph.: 011-47623456

Answers & Solutions

Time : 120 Minute

Max. Marks : 216

National Standard Examination in PHYSICS (NSEP) 2023

INSTRUCTIONS TO CANDIDATES

- (1) There are 60 questions in this paper.
- (2) Question paper has two parts. In **Part A1** (Q. No. 1 to 48) each question has four alternatives, out of which **only one** is correct. Choose the correct alternative and fill the appropriate bubble, as shown.

In **Part A2** (Q. No. 49 to 60) each question has four alternatives, out of which **any number of alternative (s)** (1, 2, 3 or 4) may be correct. You have to choose ALL correct alternative(s) and fill the appropriate bubble(s), as shown.

(3) For Part A1, each correct answer carries 3 marks whereas 1 mark will be deducted for each wrong answer. In Part A2, you get 6 marks if all the correct alternatives are marked. No negative marks in this part.

A - 1 (Attempt All Sixty Questions)

ONLY ONE OUT OF FOUR OPTIONS IS CORRECT. BUBBLE THE CORRECT OPTION

- A target of ⁷Li is bombarded with a proton beam of current 10⁻⁴ ampere for 1 hour to produce ⁷Be of activity 1.8 × 10⁸ disintegrations per second. Assuming that bombarding of 1000 protons produces one ⁷Be radioactive nucleus, the half-life of ⁷Be is estimated to be approximately
 - (a) 6887 hour (b) 4332 hour
 - (c) 2407 hour (d) 2195 hour

Sol.
$$\Delta Q = i \Delta t$$

= 10⁻⁴ × (3600)C

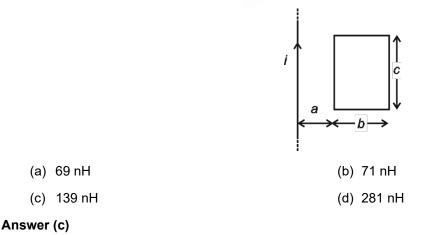

Number of protons = $\frac{10^{-4} \times 3600}{1.6 \times 10^{-19}}$

Number of Be (N) =
$$\frac{10^{-4} \times 3600}{1.6 \times 10^{-19} \times 1000}$$

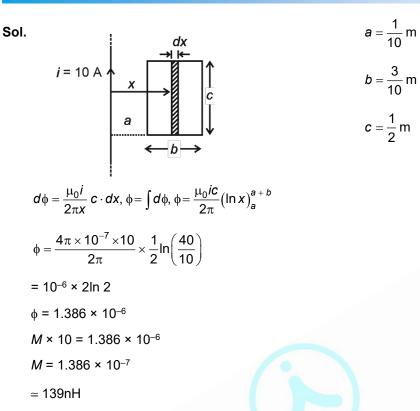

- \therefore A = λN
- $\therefore \quad \text{Half life} = \frac{\ln 2}{\lambda} = \frac{N}{A} \ln 2$

$$=\frac{10^{-4}\times3600\times\ln(2)}{1.6\times10^{-19}\times1000\times1.8\times10^{8}}$$

- = 8665200 seconds
- $\simeq 2407 \text{ hour}$
- 2. A long straight wire carrying a current i = 10 A and a rectangular metallic loop of dimensions $b \times c$ lie in the same plane as shown in the figure. The parameters are a = 10 cm, b = 30 cm and c = 50 cm. The mutual inductance of the system is nearly

3. Impedance of a given series LCR circuit, fed with alternating current, is the same for two frequencies f_1 and f_2 . The resonance frequency f_R of the circuit is

> (b) $\frac{2f_1f_2}{f_1 + f_2}$ (d) $\sqrt{f_1^2 + f_2^2}$

(a) $\frac{f_1 + f_2}{2}$

(c)
$$\sqrt{f_1 f_2}$$

Answer (c)

Sol.
$$Z = \sqrt{R^2 + (X_C - X_L)^2}$$

 $Z_1 = \sqrt{R^2 + \left(\frac{1}{C\omega_1} - L\omega_1\right)^2}$
 $Z_2 = \sqrt{R^2 + \left(\frac{1}{C\omega_2} - L\omega_2\right)^2}$
Here $Z_1 = Z_2$
So, $\frac{1}{C\omega_1} - L\omega_1 = \frac{1}{C\omega_2} - L\omega_2$
 $\frac{1}{C\omega_1} - \frac{1}{C\omega_2} = L\omega_1 - L\omega_2$
 $\frac{(\omega_2 - \omega_1)}{C\omega_1\omega_2} = L(\omega_1 - \omega_2)$

$$\frac{(\omega_2 - \omega_1)}{C\omega_1\omega_2} = -L(\omega_2 - \omega_1)$$
$$-\omega_1\omega_2 = \frac{1}{LC}$$
$$\left|-2\pi f_1 \times 2\pi f_2\right| = \left|\left(2\pi fr\right)^2\right|$$
$$f_r = \sqrt{f_1f_2}$$

4. A lawn roller is a solid cylinder of mass *M* and radius *R*. As shown in the figure, it is pulled at its center by a horizontal force *F* and rolls without slipping on a horizontal surface. Then the

NSEP-2023

5. A hydrogen atom ($M_{\rm H}$ = 1.67 × 10⁻²⁷ kg), initially at rest, emits a photon and goes from the excited state n = 5 to the ground state. The recoil speed of the atom is nearly

| (a) | 4.2 ms ^{−1} | (b) 4 × 10 ⁻⁴ ms ⁻¹ |
|-----|---------------------------------------|---|
| (c) | 2 × 10 ⁻² ms ⁻¹ | (d) 8 × 10 ² ms ⁻¹ |

Answer (a)

Sol. *n*₁ = 1

*n*₂ = 5

mass of hydrogen atom = 1.67×10^{-27} kg

$$p = \frac{h}{\lambda}$$

 $v = \frac{h}{m\lambda} \rightarrow$ recoil speed

$$\frac{1}{\lambda} = R \left(\frac{1}{n_1^2} - \frac{1}{n_2^2} \right)$$

$$\frac{1}{\lambda} = 1.097 \times 10^7 \left(\frac{1}{1^2} - \frac{1}{5^2} \right)$$

So, recoil speed
$$(v) = \frac{6.67 \times 10^{-34}}{1.6 \times 10^{-27} \times 9.48 \times 10^{-4}}$$

≈ 4.2 m/s

- 6. Two nuclides *A* and *B* are isotopes. The nuclides *B* and *C* are isobars. All the three nuclides *A*, *B* and *C* are radioactive. You may then conclude that
 - (a) the nuclides A, B and C must belong to the same element
 - (b) the nuclides A, B and C may belong to the same element
 - (c) it is possible that A may change to B through a radioactive decay process
 - (d) it is possible that B may change to C through a radioactive decay process

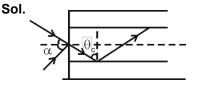

Answer (d)

Sol. $A \rightarrow (Z + N)$

- $B \rightarrow (Z + N')$
- $C \to Z' + N''$
- (a) × not same element
- (b) ×
- (c) $A \rightarrow B$ decay $p \rightarrow n$ z will change
- (d) B to C, atomic no change
- 7. Numerical aperture of an optical fibre is a measure of
 - (a) the attenuation of light through it
 - (c) the pulse dispersion through it
- (b) its resolving power
- (d) its light gathering power

Answer (d)

Numerical aperture of optical fibre (NA) = $\sin \alpha = \sqrt{n_1^2 - n_2^2}$

It is clear that on increasing NA, higher scattering loss from greater concentrations of dopant.

- \rightarrow It measures light-gathering ability.
- 8. Heavy stable nuclei have more neutrons than protons. This is because of the fact that
 - (a) neutrons are heavier than protons
 - (b) the electrostatic forces between protons are repulsive
 - (c) neutrons decay into protons through beta decay
 - (d) the nuclear forces between neutrons are weaker than those between protons

Answer (b)

Sol. In nucleus, there are two types of force,

Nuclear force \rightarrow attractive

Force among protons \rightarrow repulsive

In heavy nucleus, repulsive force is more than attractive.

But for stable heavy nucleus, these repulsive force is minimised by neutrons.

- 9. An equi-concave lens of radii of curvature of the two surfaces numerically equal to 7 cm and refractive index $\mu = 1.5$ has a small silver dot on the rear surface. As a result of this, a ray of light incident parallel to the principal axis gets reflected from its rear surface and then reflected also from the inner front surface. The ray after the second reflection emerges out of the thin lens and appears to focus at a point P on the principal axis. The point *P* lies
 - (a) 1 cm before the lens

(b) 2 cm before the lens

(c) 1 cm beyond the lens

(d) At none of these

Answer (c)

Sol. The ray undergoes 2 reflection and 3 refractions

$$\therefore \quad \frac{1}{f_{eq}} = \frac{3}{f_l} - \frac{2}{f_m}$$
$$\frac{1}{f_l} = (1.5 - 1)\frac{2}{R} = \frac{1}{R}$$
$$f_l = 7 \text{ cm}$$

$$f_m = \frac{R}{2} = -\frac{7}{2} \,\mathrm{cm}$$

$$\therefore \frac{1}{f_{eq}} = \frac{3}{7} + \frac{2}{7} \times 2 = \frac{7}{7}$$

 $f_{eq} = 1 \text{ cm}$

 \therefore It will be focused 1 cm beyond the lens.

- 10. Light emerges out uniformly from a point source placed at the focus of a concave mirror to give out a spherical wave front. As a result of reflection of the paraxial rays from the concave mirror, according to Huygen's theory the reflected light is in the form of a
 - (a) Spherical wave front with centre at the focus, and radius equal to the radius of curvature of the mirror
 - (b) Spherical wave front with centre at the focus, and radius equal to the focal length of the mirror
 - (c) Cylindrical wave front with its axis coinciding with the principal axis of the mirror
 - (d) Plane wave front perpendicular to the reflected beam

Answer (d)

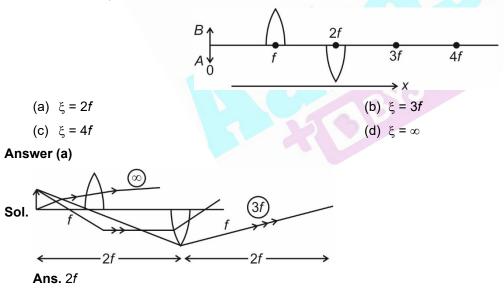

After reflection the light goes parallel to the principle axis.

... In case of parallel light, the shape of wavefront is plane.

Option (d) is correct.

11. An equi-convex lens of focal length '*f* is cut along a diameter, in two halves (pieces). The two identical pieces of the lens are now arranged as shown in the figure on a common axis at a separation *f* between the two. The image of an object *AB* placed at *x* = 0 **cannot** be formed at the distance *x* = ξ from the object along the axis, for the value of ξ as

12. During the processes of annihilation of a stationary electron of mass m_0 with a stationary positron of equal mass, a radiation is emitted. The wavelength of the resulting radiation is

| (a) | $\frac{h}{m_0c}$ | (b) | $\frac{2h}{m_0c}$ |
|-----|------------------|-----|-------------------|
| | mo | | $m_{\circ}c$ |

(c)
$$\frac{m_0}{hc}$$
 (d) $\frac{m_0c}{h}$

Answer (a)

Sol. \Rightarrow From conservation of momentum, photons will travel in opposite direction with equal magnitude of momentum $\frac{hc}{h}$

ntum
$$\frac{1}{\lambda}$$

 \Rightarrow From energy conservation

$$\frac{hc}{\lambda} + \frac{hc}{\lambda} = m_0 c^2 + m_0 c^2$$
$$\lambda = \frac{h}{m_0 c}$$

13. The convex surface of a concavo-convex lens of refractive index 1.5 and radii of curvature $R_1 = 20$ cm and $R_2 = 40$ cm has been silvered so as to make it reflecting. The distance of a luminous object from the reflecting system when placed in front of it on its principal axis, so that the image coincides with the object is

(b) 32 cm

- (a) 40 cm
- (c) 16 cm (d) 8 cm

Answer (c)

Sol.
$$R_L = 40 \text{ cm}$$

 $R_1 = 20 \text{ cm}$
 $P = \mu \text{ shed}$ $\mu = \%5$

The object should be at ${}^{2}f_{net}$, so that the image coincides with it.

Now
$$\left(-\frac{1}{f_{\text{net}}}\right) = 2\left(\frac{1}{f_{\text{lens}}}\right) + \left(-\frac{1}{f_{\text{mirror}}}\right)$$

 $-\frac{1}{f_{\text{net}}} = 2(1.5 - 1)\left(-\frac{1}{40} - \frac{1}{-20}\right) + \left(-\frac{1}{-10}\right)$
 $= \left(\frac{1}{20} - \frac{1}{40}\right) + \frac{1}{10}$
 $= \frac{1}{40} + \frac{1}{10} = \frac{10 + 40}{400}$
 $\Rightarrow f_{net} = -\frac{400}{50} = -8 \text{ cm}$
∴ $|^{2}f_{\text{net}}| = 16 \text{ cm}$

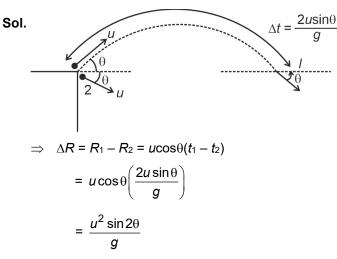

Option (c) is correct

14. Two balls are projected from the top of a cliff with equal initial speed *u*. One starts at angle θ above the horizontal while the other starts at angle θ below. Difference in their ranges on ground is

(a)
$$2\frac{u^2 \tan \theta}{g}$$
 (b) $\frac{u^2 \sin 2\theta}{2g}$
(c) $\frac{u^2 \sin 2\theta}{g}$ (d) $\frac{u^2 \cos 2\theta}{g}$

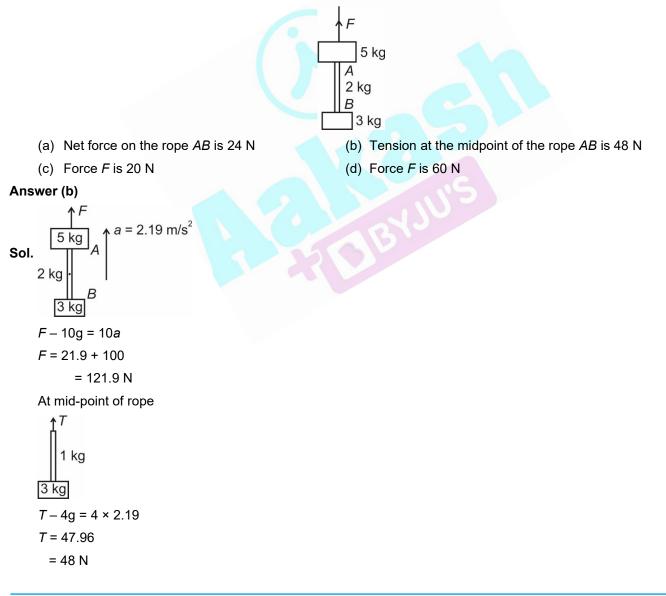

Answer (c)

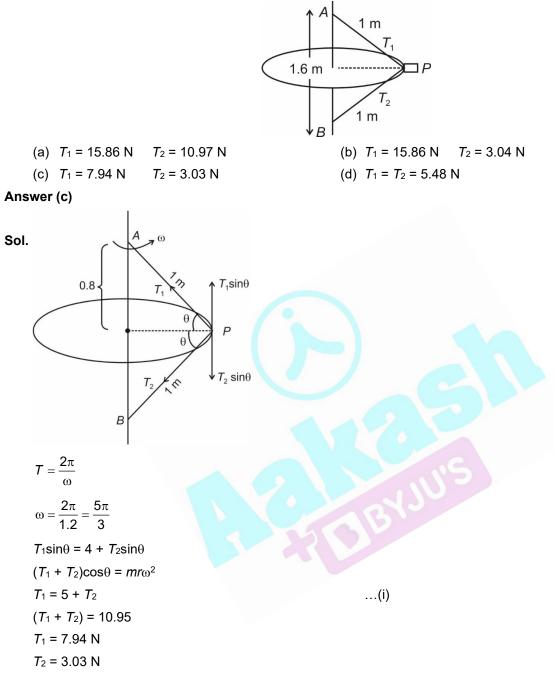

Option (c) is correct.

15. A solid block of mass 3 kg is suspended from the bottom of a 5 kg block with the help of a rope *AB* of mass 2 kg as shown in the figure. When pulled by an upward force *F*, the whole system experiences an upward acceleration $a = 2.19 \text{ ms}^{-2}$. Choose the correct option

16. A block *P* of mass 0.4 kg is attached to a vertical rotating spindle by two strings *AP* and *BP* of equal length 1.0 m as shown in the figure. The period of rotation is 1.2 s. Tensions T_1 and T_2 in string *AP* and *BP* are

17. A particle of mass m moves in a straight line under the influence of a certain force such that the power (P) delivered to it remains constant. Starting from rest, the straight-line distance travelled by the moving particle in time t is

(a)
$$\left(\frac{8Pt^3}{27m}\right)^{\frac{1}{2}}$$

(b) $\left(\frac{4Pt^3}{27m}\right)^{\frac{1}{2}}$
(c) $\left(\frac{8Pt^2}{9m}\right)^{\frac{1}{2}}$
(d) $\left(\frac{8Pt^3}{9m}\right)^{\frac{1}{2}}$

NSEP-2023

Answer (d)

 \therefore $va = \frac{P}{m}$

 $a = \frac{dv}{dt}$

$$\frac{vdv}{dt} = \frac{P}{m}$$

$$\frac{v^2}{2} = \frac{P}{m}t$$

$$v = \sqrt{\frac{2P}{m}t}$$

$$v = \frac{dx}{dt}$$

$$\int_0^x dx = \frac{2}{3}\sqrt{\frac{2P}{m}}(t)^{\frac{3}{2}}$$

$$x = \left(\frac{8}{9}\frac{P}{m}t^3\right)^{\frac{1}{2}}$$

18. A bullet is fired vertically up with half the escape speed from the surface of the Earth. The maximum altitude reached by it (ignore the effect of rotation of the Earth) in terms of radius of Earth *R* is

(a)
$$\frac{R}{3}$$
 (b) $\frac{R}{2}$
(c) R (d) $\frac{2R}{3}$

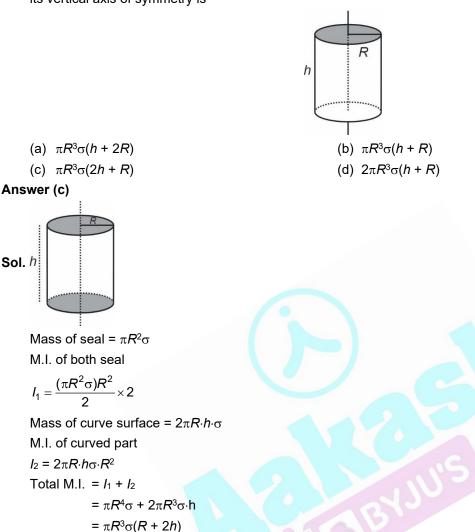

Answer (a)

Sol. $V = \sqrt{\frac{GM}{2R}}$

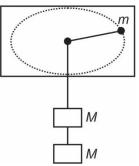

By conservation of energy

$$-\frac{GMm}{R} + \frac{1}{2}m\left(\frac{GM}{2R}\right) = -\frac{GMm}{R+h}$$
$$-\frac{3}{4}\frac{GMm}{R} = -\frac{GMm}{R+h}$$
$$h = \frac{R}{3}$$

19. A can is a hollow cylinder of radius R and height h. Its ends are sealed with circular sheets of the same material. The can is made of thin sheet metal of areal mass density $\sigma(kg/m^2)$. Moment of inertia of this closed can about its vertical axis of symmetry is

20. A particle of mass m is revolving in a horizontal circle on a frictionless horizontal table with the help of a string tied to it and passing through a hole at the center of the table. Two equal masses M are attached to the other end of the string as shown. If one of the hanging masses M is removed gently, the radius of the circular motion of m

- (a) Decreases by a factor 1.414
- (b) Increases by a factor 1.260
- (c) Increases by a factor 1.414
- (d) Does not change because of the conservation of angular momentum

Answer (b)

Sol. Initially, tension in string = 2Mg

$$\therefore \quad 2Mg = m\omega_1^2 r_1 \qquad \qquad \dots (i)$$

When one mass is removed

$$Mg = m\omega_2^2 r_2 \qquad \dots (ii)$$

By conservation of angular momentum

$$\omega_1 r_1^2 = \omega_2 r_2^2$$
$$\frac{\omega_1}{\omega_2} = \left(\frac{r_2}{r_1}\right)^2$$

On dividing (i) and (ii)

$$2 = \left(\frac{\omega_1}{\omega_2}\right)^2 \left(\frac{r_1}{r_2}\right)$$
$$2 = \left(\frac{r_2}{r_1}\right)^3$$
$$r_2 = r_1(2)^{\frac{1}{3}}$$

$$r_2 = 1.26r_1$$

21. Three stars of equal mass *M* rotate in a circular path of radius *r* about their center of mass such that the stars always remain equidistant from each other. The common angular speed (ω) of rotation of the stars can be expressed as

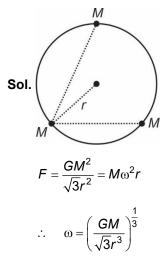

(b) $\left(\frac{GM}{r^3}\right)^{\frac{1}{2}}$

(d) $\left(\frac{GM}{r^3\sqrt{3}}\right)^{\frac{1}{2}}$

(a)
$$\left(\frac{GM\sqrt{3}}{r^3}\right)^{\frac{1}{2}}$$

(c) $\left(\frac{GM}{r^3}\frac{2}{\sqrt{3}}\right)^{\frac{1}{2}}$

Answer (d)

22. The density of a liquid is ρ at the surface. The bulk modulus of the liquid is *B*. The increase $\Delta \rho$ in the density of the liquid at a depth *h* from the surface is (with $\Delta \rho \ll \rho$)

(a)
$$\Delta \rho = \frac{\rho^2 g h}{B}$$

(b) $\Delta \rho = \frac{\rho g h}{B}$
(c) $\Delta \rho = \frac{\rho^2 g h}{2B}$
(d) $\Delta \rho = \frac{2\rho^2 g h}{B}$

Sol. ρv = constant

$$\frac{\Delta \rho}{\rho} + \frac{\Delta v}{v} = 0 \qquad \qquad \dots (i)$$

$$B = \left| \frac{\Delta \rho}{\frac{\Delta v}{v}} \right| \qquad \left| \frac{\Delta v}{v} \right| = \frac{\rho g h}{B} \qquad \dots (ii)$$

From (i) and (ii)

$$\left|\frac{\Delta\rho}{\rho}\right| = \frac{\rho g h}{B}$$

$$(\Delta \rho) = \frac{\rho^2 g h}{B}$$

23. Water flows at 1.2 m/s through a hose of diameter 1.59 cm. The time required to fill a cylindrical container of radius 2 m to a height of h = 1.25 m will be nearly

(b) 2.7 hour (d) 220 min

- (a) 18.3 hour
- (c) 550 min

```
Sol. Time = \frac{\text{Volume}}{\text{Rate of flow of liquid}}
```

$$=\frac{\pi R^2 h}{AV}$$

$$=\frac{\pi(2)^{2} \times (1.25)}{1.2 \times \pi \times \left(\frac{1.59}{2}\right)^{2} \times 10^{-4} \times 3600}$$
 hours

= 18.3 hours

- 24. A police car, moving at speed of 108 km/hour, approaches a truck moving at 72 km/hour in opposite direction. The natural frequency of the siren of the car is 800 Hz and the surrounding temperature is 27°C. The frequency heard by the truck driver as the car passes him
 - (a) Remains unchanged
 - (c) Increases nearly by 231 Hz
- (b) Decreases nearly by 232 Hz
- (d) Decreases nearly by 260 Hz

Answer (b)

Sol. Velocity of sound $=\sqrt{\frac{\gamma RT}{M}}$ $=\sqrt{\frac{1.4\times8.3\times300\times1000}{28.97}} = 346.88 \text{ m/s}$ *f* = 800 Hz $V_{\rm car} = 108 \times \frac{5}{18} = 30 \text{ m/s}$ $V_{\text{truck}} = 72 \times \frac{5}{18} = 20 \text{ m/s}$ $\therefore \quad f' = \left(\frac{V_{\rm S} + V_{\rm truck}}{V_{\rm S} - V_{\rm car}}\right) \times 800$ $=\frac{366.88}{316.88}\times800=926.230$

When car passes

$$f'' = \left(\frac{V_{\rm S} - V_{\rm truck}}{V_{\rm S} + V_{\rm car}}\right) \times 800 = \frac{326.88}{376.88} \times 800 = 693.86$$

$$\therefore \quad \Delta f = -232 \text{ Hz}$$

25. A rope of mass M and length L hangs vertically. Time needed for a transverse pulse to travel from its bottom end to the support is

 $\sqrt{\frac{L}{2g}}$

(a)
$$\sqrt{\frac{2L}{g}}$$

(b) $2\sqrt{\frac{L}{g}}$
(c) $\sqrt{\frac{L}{g}}$
(d) $\sqrt{\frac{L}{2g}}$
Answer (b)

Sol.

$$\int_{L} \frac{1}{\int_{L} \frac{1}{\int_{L} \frac{T}{T}}} M dx = \int_{L} \frac{T}{T} dx$$

$$T = \frac{Mx}{L}g$$

$$\therefore \quad v = \sqrt{\frac{T}{\mu}} = \sqrt{gx}$$

$$v = \frac{dx}{dt} = \sqrt{gx}$$

$$\int_{0}^{L} \frac{dx}{\sqrt{x}} = \sqrt{g} \int_{0}^{t} dt$$

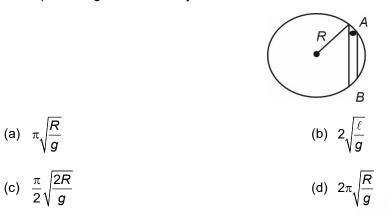

$$2\sqrt{L} = \sqrt{g} t$$

$$\therefore \quad t = 2\sqrt{\frac{L}{g}}$$

26. The figure shows a smooth tunnel AB (length = 2ℓ) in a uniform density planet (say Earth) of mass M and radius

R. A small ball of mass m is released from rest at the end A of the tunnel. Acceleration due to gravity at surface of the planet is g. Time taken by the ball to reach the end B is

Answer (a)

Sol. Time period of oscillation

$$T = 2\pi \sqrt{\frac{R}{g}}$$

Time taken from one extreme to another $=\frac{T}{2}$

$$\therefore t = \pi \sqrt{\frac{R}{g}}$$

27. When the speaker S_1 is switched ON, the sound intensity at a point *P* in a room is 80 dB. But when the speaker S_2 is switched ON (S_1 is switched OFF), the sound intensity at the same point *P* in the room is 85 dB. The sound intensity level (in dB) at the same point *P* in the room, if the two speakers S_1 and S_2 are simultaneously switched ON, is (consider the speakers to be incoherent)

(b) 86.2 dB

(d) 88.6 dB

- (a) 165 dB
- (c) 87.8 dB

Answer (b)

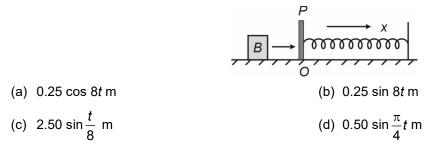

Sol. Total intensity $I = I_1 + I_2$

$$80 = 10 \log\left(\frac{I_1}{I_0}\right)$$
$$85 = 10 \log\left(\frac{I_2}{I_0}\right)$$
$$L = 10 \log\left(\frac{I_1 + I_2}{I_0}\right)$$
$$L = 86.2 \text{ dB}$$

NSEP-2023

28. A block *B* of mass 0.5 kg moving, on a horizontal frictionless table at 2.0 ms⁻¹, collides with a massless pan *P* (at origin *O*) and sticks to it. The pan is connected at the end of a horizontal un-stretched (relaxed) spring of force constant $K = 32 \text{ Nm}^{-1}$ as shown in figure. After the block collides, the displacement *x*(*t*) of the block as a function of time *t* is given by

Answer (b)

Sol. It is a simple harmonic motion

$$\omega = \sqrt{\frac{K}{m}} = \sqrt{\frac{32}{0.5}} = 8$$

Amplitude $A = \sqrt{\frac{\frac{1}{2}mv^2}{\frac{1}{2}K}} = \sqrt{\frac{0.5 \times 4}{32}} = \sqrt{\frac{1}{16}}$
$$= \frac{1}{4} = 0.25 \text{ m}$$

At t = 0, block is at its mean position

、 ¬

29. Which of the following functions does not represent a traveling wave?

(a)
$$y = A \sin^2 \left\lfloor \pi \left(t - \frac{x}{v} \right) \right\rfloor$$

(b) $y = A e^{-\alpha t} \cos(kx - \omega t)$
(c) $y = A \sin \left[(kx)^2 - (\omega t)^2 \right]$
(d) $y = A \cos \left[(kx - \omega t)^2 \right]$
Answer (c)

Sol. For travelling wave

$$\frac{d^2y}{dt^2} = v^2 \frac{d^2y}{dx^2}$$

For option (c)

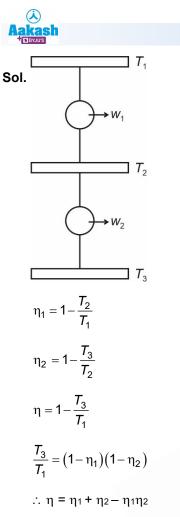

$$\frac{d^2y}{dt^2} \neq v^2 \frac{d^2y}{dx^2}$$

 \therefore It is not a travelling wave

30. Two Carnot heat engines are connected in series such that the sink of the first engine is heat source of the second. Efficiency of the engines are η_1 and η_2 respectively. Net efficiency η of the combination is given by

(a)
$$\eta = \eta_1 + \eta_2$$

(b) $\eta = \frac{\eta_1 \eta_2}{\eta_1 + \eta_2}$
(c) $\eta = \eta_1 + \eta_2 (1 - \eta_1)$
(d) $\eta = \eta_1 - \eta_2 (1 - \eta_1)$
Answer (c)

- 31. An air bubble of radius 2 mm at a depth 12 m below the surface of water at temperature of 8°C, rises to the surface where the temperature is 16°C. Neglecting the effect of Surface Tension, the radius of the bubble at the surface is estimated to be
 - (a) 2.56 mm
 - (c) 2.86 mm

Sol.
$$\frac{P_1V_1}{T_1} = \frac{P_2V_2}{T_2}$$

 $P_1 = P_0 + \rho gh$
 $h = 12 \text{ m}$
 $P_1 = 2.2 \times 10^5$
 $P_2 = P_0 = 10^5$
 $T_1 = 281$
 $T_2 = 289$
 $\therefore \frac{V_2}{V_1} = \frac{2.2}{1} \times \frac{289}{281} = 2.26$
 $\therefore r_2 = r_1(2.26)^{\frac{1}{3}}$

 $r_2 = 2.61 \text{ mm}$

(b) 2.61 mm (d) 4.45 mm

32. Two soap bubbles of radii *a* and *b* coalesce to form a single bubble of radius *c* under isothermal conditions. If the external pressure is P_A , then the Surface Tension (*T*) of the soap solution is

(a)
$$\frac{P_A}{4} \frac{(c^3 - a^3 - b^3)}{(a^2 + b^2 - c^2)}$$

(b) $\frac{P_A}{2} \frac{(a^3 + b^3 - c^3)}{(c^2 - a^2 - b^2)}$
(c) $\frac{P_A}{2} \frac{(a^2 + b^2 - c^2)}{(c^3 - a^3 - b^3)}$
(d) $\frac{P_A}{4} \frac{(c^2 - a^2 - b^2)}{(a + b - c)}$

Answer (a)

Sol. $P_1V_1 + P_2V_2 = P_3V_3$

$$\left(P_A + \frac{4T}{a}\right)a^3 + \left(P_A + \frac{4T}{b}\right)b^3 = \left(P_A + \frac{4T}{c}\right)c^3$$
$$P_A(a^3 + b^3 - c^3) = 4T(c^2 - b^2 - a^2)$$
$$\therefore T = \frac{P_A}{4}\frac{\left(a^3 + b^3 - c^3\right)}{\left(c^2 - b^2 - a^2\right)}$$

33. An open-end organ pipe 30 cm in length and a closed-end organ pipe 23 cm in length, both of equal diameter, are each sounding their first overtone and both are in unison at 1100 Hz. The speed of sound in air, is estimated to be nearly

(b) 332 ms⁻¹

(d) 352 ms⁻¹

- (a) 324 ms⁻¹
- (c) 340 ms⁻¹

Answer (d)

Sol. For open end organ pipe

for 1st overtone
$$f = \frac{v}{(l_1 + 2e)}$$

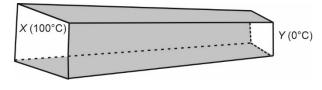

For closed end organ pipe

for 1st overtone
$$f = \frac{3v}{4(l_2 + e)}$$

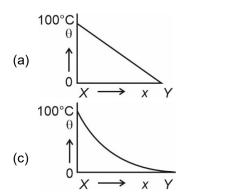

f = 1100 Hz

$$l_1 + 2\mathbf{e} = \frac{\mathbf{v}}{\mathbf{f}}$$
$$l_2 + \mathbf{e} = \frac{3\mathbf{v}}{4\mathbf{f}}$$

34. The figure shows a lagged bar XY of non-uniform cross section. One end X of the bar is maintained at 100°C and the other end Y at 0°C. The variation of temperature along its length from X to Y in steady state is best represented by the curve.

Answer (b)

Sol. Side of the cross-section varies linearly.

$$\therefore \ell = \ell_0 - xc$$

$$a = \ell^2 = (\ell_0 - xc)^2$$

Q is same through all cross-section

$$Q = \frac{(T_X - T)}{x} K(\ell_0 - xc)^2$$
$$\therefore T = T_x - \frac{Qx}{K(\ell_0 - xc)^2}$$

35. An ideal gas (*n* moles) is initially at pressure *P* and temperature *T*. It is cooled isochorically to a pressure $\frac{P}{4}$.

The gas is then expanded at a constant pressure so as to attain back its initial temperature *T*. Work done by gas during the entire process is

- (a) $\frac{5}{4} nRT$ (b) $\frac{3}{4} nRT$ (c) $\frac{1}{4} nRT$ (d) Zero Answer (b)
- **Sol.** In Isochoric process W = 0

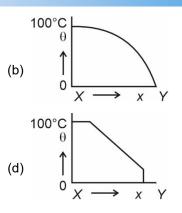

```
In Isobaric process W = nR\Delta T
```

$$T_{2} = T$$
$$T_{1} = \frac{T}{4}$$
$$\therefore W = nR\left(T - \frac{T}{4}\right)$$
$$= \frac{3}{4}nRT$$

36. Assuming the Sun to be a spherical body (radius R_S) of surface temperature *T*, the total radiation power received by Earth (radius R_E) at a distance *r* from Sun is

(a)
$$\frac{\sigma \pi R_E^2 R_S^2 T^4}{r^2}$$
 (b) $\frac{\sigma 4 \pi R_E^2 R_S^2 T^4}{r^2}$
(c) $\frac{\sigma \pi R_E^2 R_S^2 T^4}{4r^2}$ (d) $\frac{\sigma R_E^2 R_S^2 T^4}{4\pi r^2}$

Answer (a)

(a)

(b)

(c)

(d)

•

 $\frac{q_1}{1^2}$

 q_1

 q_1

Sol. Power radiated by Sun = $\sigma \epsilon 4\pi R_S^2 T^4$

Intensity at earth =
$$\frac{\sigma \epsilon 4\pi R_S^2 T^4}{4\pi r^2}$$

 \therefore Power received by Earth = $\pi R_E^2 \times I = \frac{\pi R_E^2 \sigma \epsilon R_S^2 T^4}{r^2}$
 $\epsilon = 1$ for sun

$$\therefore \quad \varepsilon = \frac{\sigma \pi R_E^2 R_S^2 T^4}{r^2}$$

37. The figure shows five point-charges on a straight line. Separation between successive charges is 10 cm. For what values of q_1 and q_2 would the net force on each of the other three charges be zero?

$$2 \mu C \quad q_1 \quad 1 \mu C \quad q_2 \quad 2 \mu C$$

$$(a) \quad q_1 = q_2 = -\frac{27}{80}\mu C$$

$$(b) \quad q_1 = q_2 = \frac{27}{40}\mu C$$

$$(c) \quad q_1 = \frac{27}{80}\mu C \quad q_2 = -\frac{27}{80}\mu C$$

$$(d) \quad q_1 = q_2 = -\frac{27}{40}\mu C$$
Answer (a)
Sol. $2 \mu C \quad q_1 \quad 1 \mu C \quad q_2 \quad 2 \mu C$
Force on $1 \mu C$ to be zero.
$$\frac{2}{(2)^2} + \frac{q_1}{(1)^2} - \frac{q_2}{(1)^2} - \frac{2}{(2)^2} = 0$$

$$\therefore q_1 = q_2$$
Force on $2 \mu C$ to be zero.
$$\frac{q_1}{1^2} + \frac{1}{2^2} + \frac{q_2}{3^2} + \frac{2}{4^2} = 0$$

$$q_1\left(1 + \frac{1}{9}\right) = -\left(\frac{1}{4} + \frac{2}{16}\right)$$

$$q_1\left(\frac{10}{9}\right) = -\frac{6}{16}$$

$$q_1 = -\frac{27}{80}\mu C$$

38. Two equal blocks, each of mass *M*, hang on either side of a frictionless light pulley with a light string. A rider of mass *m* is placed on one of the blocks (as shown). When the system is released, the block with rider descends a distance *H* till the rider is caught by a ring that allows the block to pass through. The system moves a further distance *D* taking time *t*. In such a situation, the acceleration due to gravity is

(a)
$$g = \frac{(2M+m)D^2}{2mHt^2}$$

(b) $g = \frac{(M+m)D^2}{2mHt^2}$
(c) $g = \frac{(2M+m)D}{mHt^2}$
(d) $g = \frac{(M+2m)D^2}{mHt^2}$
(d) $g = \frac{(M+2m)D^2}{mHt^2}$
Answer (a)
Sol. Acceleration of blocks $= = \frac{m}{(2M+m)}g$
 \therefore velocity after descending H
 $v = \sqrt{\frac{2mgH}{(2M+m)}}$
After that velocity is constant
 $\therefore D = vt$
 $D^2 = \frac{2mgH}{(2M+m)}t^2$
 $(2M+m)D^2$

 $g = \frac{(2mHt^2)}{2mHt^2}$

39. A very small electric dipole of dipole moment \vec{p} lies along the x axis $(i.e. \vec{p} = p\hat{i})$ in a non-uniform electric field

$$\vec{E} = \frac{c}{x}\hat{i}$$
 (where *c* is a constant). The force on the dipole is
(a) $\frac{cp}{x^2}\hat{i}$ (b) $-\frac{c\vec{p}}{x^2}\hat{i}$
(c) $\frac{cp}{x}\hat{i}$ (d) Zero

Answer (b)

Sol.
$$F = p \frac{dE}{dx}$$

 $= p \frac{d}{dx} \left(\frac{c}{x}\right)$
 $F = -\frac{pc}{x^2} \hat{i}$

- 40. A conducting thick spherical shell of radii *a* and *b* (b > a) has been charged with uniform surface charge density $-\sigma C/m^2$ on the inner and $+\sigma C/m^2$ on the outer surface. Then
 - (a) the net charge on the spherical shell is zero.
 - (b) the radial electric field outside the shell is $E = \frac{\sigma b^2}{\varepsilon_0 r^2}$
 - (c) a radial electric field $E = \frac{\sigma(b^2 a^2)}{\varepsilon_0 r^2}$ exists outside the shell.
 - (d) there is a net electric charge in the cavity (i.e., in region r < a) equal to $4\pi\sigma(b^2 a^2)$

Answer (b)

Sol. Total Charge = $4\pi\sigma(b^2 - a^2)$

Electric field outside =
$$\frac{\sigma b}{\varepsilon_0 r^2}$$

Charge in the cavity = $4\pi\sigma a^2$

- 41. A spherical conductor is charged up to a potential of 450 V. The potential outside, at a distance 15 cm from the surface, is 300 V. Then
 - (a) The potential at 15 cm from the centre is 900 V
 - (b) The charge on the conductor is 1.5 nC
 - (c) The electric field just outside the surface is 150 N/C
 - (d) The total electrical energy of the conductor is $U = 3.375 \,\mu$ J

Answer (d)

Sol. $\frac{1}{4\pi\epsilon_0} \frac{Q}{R} = 450$...(1)

$$\frac{1}{4\pi\varepsilon_0}\frac{Q}{R+0.15} = 300 \qquad ...(2)$$

$$\Rightarrow \frac{R+0.15}{R} = 1.5 \Rightarrow \frac{0.15}{R} = 0.5 \Rightarrow R = 30 \text{ cm}$$

$$\Rightarrow \mathbf{Q} = \frac{450 \times 0.30}{9 \times 10^9} \mathbf{C} = 15 \text{ nC}$$

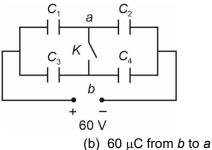

$$E_{\text{surface}} = \frac{1}{4\pi\epsilon_0} \frac{Q}{R^2} = 9 \times 10^9 \times \frac{15 \times 10^{-9}}{0.3^2}$$

= 1500 N/C

Electrical energy of the conductor = $\frac{Q^2}{8\pi\epsilon_0 R}$

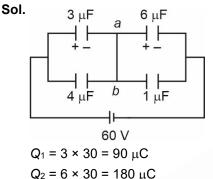

42. Capacitors $C_1 = 3 \mu F$, $C_2 = 6 \mu F$, $C_3 = 4 \mu F$ and $C_4 = 1 \mu F$ are connected in a circuit as shown to a battery of 60 V. Now if key *K* is closed, the charge that will flow through *K* is

(d) 150 μC from b to a

- (a) 90 μC from *b* to *a*
- (c) 30 µC from *a* to *b*

Answer (a)

∴ charge flown from switch

From *b* to *a*

43. The electrical conductivity of a sample of semiconductor is found to increase when the electromagnetic radiation of wave length just shorter than 2480 nm is incident normally on its surface. The band gap of the semiconductor is

(b) 1.12 eV (d) 0.29 eV

- (a) 1.96 eV
- (c) 0.50 eV

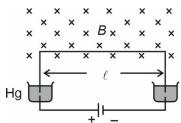

Answer (c)

Sol.
$$E_g = \frac{hc}{\lambda}$$
$$= \frac{1240 \text{ eV} \cdot \text{nm}}{2480 \text{ nm}}$$

= 0.5 eV

- 44. A U-shaped conducting wire of mass m = 10 g, having length of its horizontal section as $\ell = 20$ cm, is free to move vertically up and down. The two ends of the wire are immersed in mercury for proper electrical contact. The wire is in a homogenous field of magnetic induction B = 0.1 T as shown. The wire jumps up to a height h = 3 m when a charge q, in the form of a current pulse, is sent through the wire. Considering that the duration of the current pulse is very small compared to the time of flight, the charge q passed through the wire is estimated to be nearly
 - (a) 6.85 μC
 - (b) 9.80 µC
 - (c) 2.84 C
 - (d) 3.84 C

Sol. Magnetic force $F = i\ell B$

$$\Rightarrow \text{ impulse} = \int (i\ell B) dt$$
$$= B\ell \int idt$$
$$= B\ell q = Mv$$
$$\Rightarrow v = \frac{B\ell q}{M} = \sqrt{2gh}$$
$$\Rightarrow q = \frac{M}{B\ell} \sqrt{2gh}$$
$$= \frac{10}{0.1 \times 0.2} \sqrt{2 \times 10 \times 3}$$
$$= \frac{1}{2} \sqrt{60} = \sqrt{15} \approx 3.84 \text{ C}$$

- 45. A direct vision spectroscope has been designed to obtain dispersion without deviation by arranging alternate inverted thin prisms of crown glass (refractive index $\mu_1 = \sqrt{2}$) and flint glass ($\mu_2 = \sqrt{3}$) with refracting angle $\theta_{\text{flint}} = 3^\circ$. The refracting angle θ_{crown} of the crown glass prism is
 - (a) 3.0° (b) 4.5° (c) 5.3° (d) 6.0°

Answer (c)

Sol. For no deviation,

$$(\mu - 1)A = (\mu' - 1)A'$$

$$\Rightarrow (\sqrt{2} - 1) \theta_{\text{crown}} = (\sqrt{3} - 1) 3$$

$$\Rightarrow \theta_{crown} = 5.3^{\circ}$$

- 46. Continuous and characteristic X-rays are produced when electron beam accelerated by a high potential difference of V volt (say) is made to hit the metallic target such as Molybdenum in a modern Coolidge tube. Let λ_{min} be the smallest possible wavelength of continuous X-rays and $\lambda_{L\alpha}$ be the maximum wavelength of the characteristic X-rays. Then
 - (a) $\lambda_{L\alpha}$ increases with increase in V (c) λ_{min} increases with increase in V
- (b) $\lambda_{L\alpha}$ decreases with increase in V
- (d) λ_{min} decreases with increase in V

Answer (d)

Sol. Since $\lambda_{L\alpha}$ is characteristic, it will be independent of *V*.

Also,
$$\lambda_{\min} = \frac{hc}{eV}$$

47. While performing an experiment for determining the focal length of a concave mirror by u-v method, a student recorded the given sets of the positions (in cm) of the object and the corresponding image on the bench as (12, 51), (18, 54), (30, 50), (48, 34), (42, 42) and (78, 98). She used an optical bench of length 1.5 m and the mirror is fixed at the 90 cm mark on the bench. The maximum acceptable error in the location of the image is 0.2 cm. The reading (observation) that cannot be obtained from experimental measurement and has been incorrectly recorded, for a mirror of focal length = 24 cm, is

| (a) | (18, 54) | (b) (30, 50) |
|-----|----------|--------------|
| | | |

(c) (48, 34) (d) (78, 98)

Answer (d)

Sol. The co-ordinates (x, y) must satisfy

$$\frac{1}{90-x} + \frac{1}{90-y} = \frac{1}{24}$$

- 48. A parallel beam, of 6.0 mW radiation of wavelength 200 nm and of area of cross-section 1.0 mm², falls normally on a plane metallic surface. If the radiations are completely reflected, the pressure exerted by the radiations on the metallic surface is estimated to be
 - (a) 1 × 10⁵ Pa
 - (b) 2 × 10⁵ Pa
 - (c) 2 × 10⁻⁵ Pa
 - (d) 4 × 10⁻⁵ Pa

Answer (d)

Sol.
$$P = \frac{2l}{C}$$

$$= 2 \times \frac{\frac{6 \times 10^{-3}}{1 \times 10^{-6}}}{3 \times 10^{8}} \, \text{N/m}^{2}$$

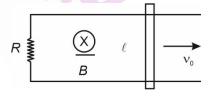

= 4 × 10⁻⁵ Pa

ANY NUMBER OF OPTIONS 4, 3, 2 OR 1 MAY BE CORRECT MARKS WILL BE AWARDED ONLY IF ALL THE CORRECT OPTIONS ARE BUBBLED

49. A metal rod of mass m and length l slides on frictionless parallel metal rails of negligible resistance. A resistance

R is connected between the rails at their ends as shown in the figure. A uniform magnetic field *B* is directed into the plane of paper perpendicular to the plane of rails throughout the space. The rod is given an initial velocity v_0 (towards right). No other force acts on the rod. Then

(a) $v(t) = v_0 e^{\frac{-B\ell t}{mR}}$

- (b) The rod stops after traveling a distance $x = \frac{mv_0R}{B^2\ell^2}$
- (c) The total energy dissipated in resistance is $\frac{1}{4}mv_0^2$ i.e. half of the initial kinetic energy
- (d) The total charge that flows in the circuit is $q = \frac{mv_0}{B\ell}$

Answer (b & d)

Sol. ε = *B*ℓ*v*

$$\Rightarrow \text{ Force on rod} = -i\ell B = -\frac{B\ell v}{R}. \ell.$$

$$\Rightarrow -\frac{B^2 \ell^2}{R} v = \frac{m \, dv}{dt}$$

$$\Rightarrow \frac{dv}{v} = -\frac{B^2 \ell^2}{mR} dt$$

$$\Rightarrow v = v_0 e^{\frac{-B^2 \ell^2 t}{mR}}$$

$$\Rightarrow \frac{dx}{dt} = v_0 e^{\frac{-B^2 \ell^2 t}{mR}}$$

$$\Rightarrow \Delta x = v_0 e^{\frac{-B^2 \ell^2 t}{mR}}$$

$$\Rightarrow \Delta x = v_0 \frac{1}{\frac{B^2 \ell^2}{mR}} = \frac{m v_0 R}{B^2 \ell^2}$$
Also, $iR = B\ell v$

$$\Rightarrow \int i \, dt = \frac{B\ell}{R} \int v \, dt$$

$$=\frac{B\ell}{R} \cdot \Delta x = \frac{mv_0}{B\ell}$$

 \Rightarrow Options b & d

50. The magnetic field $\vec{B} = 2 \times 10^{-5} \sin \left\{ \pi \left(0.5 \times 10^3 x + 1.5 \times 10^{11} t \right) \right\} \hat{j} T$ represents a plane electromagnetic wave travelling in space with *x* in meter and *t* in second. The correct statement(s) are

[::ε = *i*R]

(a) The wave length of the wave is 4.0 mm and its frequency is 75 GHz

В

- (b) The energy density associated with the wave is nearly = $316 \ \mu J/m^3$
- (c) The electric field vector is $\vec{E} = -6000 \sin \left[\pi \left(0.5 \times 10^3 x 1.5 \times 10^{11} t \right) \right] \hat{k} \text{ Vm}^{-1}$
- (d) The electric field vector is $\vec{E} = 6000 \sin \left[\pi \left(0.5 \times 10^3 x + 1.5 \times 10^{11} t \right) \right] \hat{k} \text{ Vm}^{-1}$

Answer (a & d)

Sol.

$$\overrightarrow{E} = \overrightarrow{f} = \overrightarrow{v}$$

$$\overrightarrow{E} \times \overrightarrow{B} = \overrightarrow{v}$$

$$\overrightarrow{E} \times \overrightarrow{B} = \overrightarrow{v}$$

$$\overrightarrow{E} \times \overrightarrow{B} = \overrightarrow{v}$$

$$\overrightarrow{K} = \pi \times 0.5 \times 10^{3} \Rightarrow \frac{2\pi}{\lambda} = 500\pi$$

$$\Rightarrow \lambda = \frac{1}{250} \text{ m} = 4 \text{ mm}$$

Aslo $\omega = \pi \times 1.5 \times 10^{11} = 2\pi f \Rightarrow f = 75 \text{ GHz}$

Energy density
$$\mu = \frac{B_0^2}{2\mu_0} = \frac{4 \times 10^{-10}}{2 \times 4\pi \times 10^{-7}} \text{ J/m}^3$$

= $\frac{1}{2\pi} \times 10^{-3} \text{ J/m}^3 \approx 159 \text{ }\mu\text{J/m}^3$

Also, $\vec{E} = [2 \times 10^{-5} \times 3 \times 10^{8}] \sin \left[\pi \left\{ 0.5 \times 10^{3} \, x + 1.5 \times 10^{11} \, t \right\} \right] \hat{k} \text{ N/C}$

- \Rightarrow options a & d
- 51. The force F(x) acting on a body of mass m changes with position x (in meter) as shown. It is given that the potential energy U(x) = 0 at x = 0

Choose correct option(s).

$$F(N) = 0 \text{ at } x = 0, x = 3 \text{ and } x = 6$$
(a) $U(x) = 0 \text{ at } x = 0, x = 3 \text{ and } x = 6$
(b) $U(x) = 2x^3 - 12x \text{ for } 2 \le x \le 4$
(c) $U(x) = -x^3 + 12x - 40 \text{ for } 4 \le x \le 6$
(d) At $x = 3, U(x) = -10 \text{ J}$
Answer (d)
Sol. $F = -\frac{dU}{dx}$
 $\Rightarrow dU = -F dx$
 $\Rightarrow \int_{0}^{x} dU = \int_{0}^{x} -F dx$
 $\Rightarrow U(x) = \int_{0}^{x} F dx$
 $[2, 4] : F = -4x + 12$
 $\Rightarrow U(x) = -\left[8 + \frac{x}{2}(12 - 4x)dx\right]$
 $= -[8 + 12(x - 2) - 2(x^2 - 4)] = 2x^2 - 12x + 8$
 $[4, 6] : F = 3x - 18$
 $\Rightarrow U = -\left[8 + \frac{x}{4}(3x - 18)dx\right]$
 $= -\left[8 + \frac{3}{2}(x^2 - 16) - 18(x - 4)\right]$
 $= -\frac{3}{2}x^2 + 18x - 56$
 $U(x = 3) = 2(3)^2 - 12(3) + 8 = 18 - 36 + 8 = -10 \text{ J}$

NSEP-2023

52. A deuteron of mass *M* moving at speed v collides elastically with an α -particle of mass 2*M*, initially at rest. The deuteron is scattered through 90° from initial direction of its motion with speed V_d while the α -particle is scattered with speed V_α at an angle θ from the initial direction of motion of deuteron. Then

(a)
$$\theta = 30^{\circ}$$

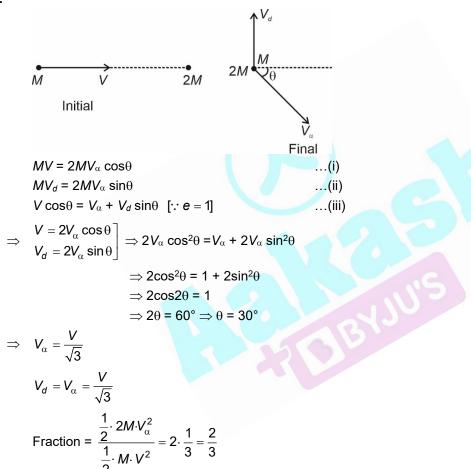

(b)
$$V_{\alpha} = \frac{v}{\sqrt{3}}$$

(c)
$$V_d = \frac{v}{\sqrt{3}}$$

(d) A fraction $\frac{2}{3}$ of energy of deuteron is transferred to α particle

Answer (a, b, c & d)

Sol.

$$\Rightarrow$$
 Options a, b, c, & d

53. Two plane progressive waves travelling on a string as

$$Y_1 = 2.5 \times 10^{-3} \sin(30x - 420t)$$

 $Y_2 = 2.5 \times 10^{-3} \sin(30x + 420t)$

Superimpose to produce a standing wave. The variables *x* and *y* are in meter and *t* is in second. Then

- (a) The equation of resultant standing wave is $y = 5 \times 10^{-3} \cos(30x) \sin(420t)$
- (b) The equation of resultant standing wave is $y = 2.5 \times 10^{-3} \sin(30x) \cos(420t)$
- (c) The antinode closest to x = 0.25 m is at x = 0.262 m
- (d) The amplitude of oscillation of particle at x = 0.17 m is 4.63 mm

Answer (c & d)

Sol.
$$y = y_1 + y_2$$

 $= 2.5 \times 10^{-3} [2 \sin(30x) \cos(420t)]$ = 5 × 10⁻³ sin(30x) cos(420t)

For antinode, $sin(30x) = \pm 1$

$$\Rightarrow$$
 30x = (2n-1) $\frac{\pi}{2}$

$$\Rightarrow x = (2n-1)\frac{\pi}{60}$$

$$(2n-1)\frac{\pi}{60} = \frac{1}{4} \Rightarrow n = 2.88 \Rightarrow$$
 For closest, $n = 3$

- $\Rightarrow x \simeq 0.262 \text{ m}$
- $\Rightarrow A(x = 0.17 \text{ m}) = |5 \times 10^{-3} \sin(30 \times 0.17)| \text{ m} \approx 4.6 \text{ mm}$
- \Rightarrow Options c & d
- 54. Two moles of nitrogen in a container, of negligible thermal capacity, are initially at 17°C. The gas is compressed adiabatically from an initial volume of 120 liter to 80 liter. The correct option(s) is/are

...(i)

...(ii)

- (a) Initial pressure of the gas is nearly 40.2 kPa
- (b) Final temperature of the gas is nearly 68°C
- (c) Work done by the gas is 2.12 kJ
- (d) The internal energy of the gas increase by 2.12 kJ

Answer (a, b & d)

Sol. PV^{γ} = constant

PV = nRT

 $\Rightarrow P_i \times (120 \times 10^{-3}) = 2 \times 8.314 \times 290$

$$\Rightarrow P_i \simeq 40.2 \text{ kPa}$$

$$TV^{\gamma-1} = c$$

$$\Rightarrow$$
 (290) (120)^{2/5} = (T_f) (80)^{2/5}

$$\Rightarrow T_f = 290 \left(\frac{3}{2}\right)^{2/5} \text{K} \simeq 68^{\circ}\text{C}$$
$$W = \frac{nR[T_i - T_f]}{\gamma - 1} = \frac{-2 \times 8.314}{\frac{2}{5}} \times 51 \text{ J} \simeq -2.12 \text{ kJ}$$

$$\Rightarrow \Delta U = -W = +2.12 \text{ kJ}$$

- \Rightarrow Options (a), (b) & (d)
- 55. A small dipole is placed at the origin with its dipole moment $\vec{P} = p\hat{i}$ oriented along x axis. *E* and *V*, are respectively, the electric field and potential at point A(x, y). The observations at the Point A(x, y) which is at a large distance *r* from the origin, show that

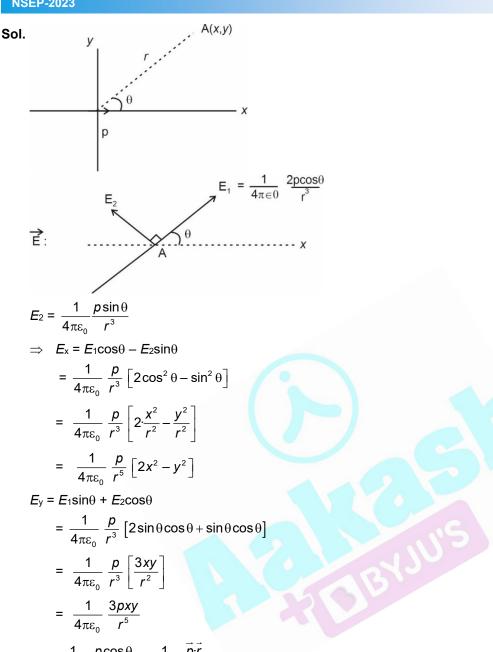

(a)
$$E_x = \frac{1}{4\pi\epsilon_0} \frac{p(2x^2 - y^2)}{r^5}$$

(b) $E_x = \frac{1}{4\pi\epsilon_0} \frac{p(x^2 - 2y^2)}{r^5}$
(c) $E_y = \frac{1}{4\pi\epsilon_0} \frac{3 p x y}{r^5}$
(d) $V = \frac{1}{4\pi\epsilon_0} \frac{\vec{P} \cdot \vec{r}}{r^3}$

Answer (a, c & d)

NSEP-2023

$$V = \frac{1}{4\pi\varepsilon_0} \frac{\rho\cos\theta}{r^2} = \frac{1}{4\pi\varepsilon_0} \frac{\rho r}{r^2}$$

Option a, c, & d \Rightarrow

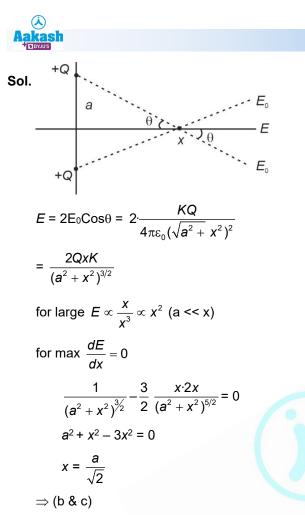

56. Two equal positive charges +Q each lie on y axis at (0, a) and (0, -a). The electric field strength E at a point (x, 0) satisfies:

(a)
$$E = \frac{1}{4\pi\varepsilon_0} \frac{2Qa}{(x^2 + a^2)^{3/2}}$$

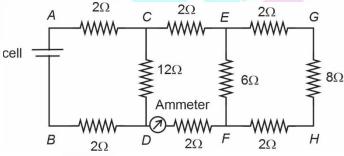

- (b) for large values of x (*i.e.*, x >> a), the electric field $E \propto \frac{1}{x^2}$
- (c) for $x \ge 0$, *E* is maximum at $x = \frac{a}{\sqrt{2}}$

(d) for
$$x \ge 0$$
, *E* is maximum at $x = 0$ and is equal to $\frac{1}{4\pi\varepsilon_0} \frac{2Q}{a^2}$

Answer (b & c)

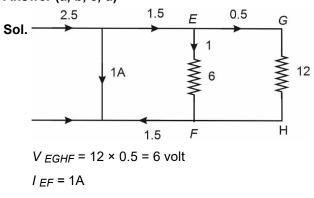

57. In the circuit shown, the current in the 8 Ω resistance across *G* and *H* is *i* = 0.5 ampere. The ammeter is ideal. The internal resistance of the cell is 0.8 Ω . Choose correct option(s).

- (a) Reading of the ammeter is 1.5 ampere
- (b) Potential difference across A and H is 13 V
- (c) Potential difference across C and F is 9 V

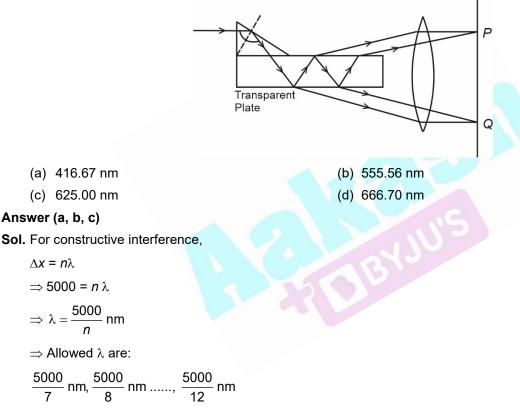

(d) The emf of the cell is 24 V

 $V_{CD} = 1.5 \times 2 + 1 \times 6 + 1.5 \times 2$ = 12 volt $V_{ACDB} = 2.5 \times 2 + 1 \times 12 \times 2.5 \times 2 + 2.5 \times 0.8$ = 5 + 12 + 5 + 2 = 24 $V_{CF} = 2 \times 1.5 + 1 \times 6 = 9 \text{ V}$ (C) $V_{AH} = 2.5 \times 2 + 1.5 \times 2 + 0.5 \times 10$ = 5 + 3 + 5 = 13 (B)

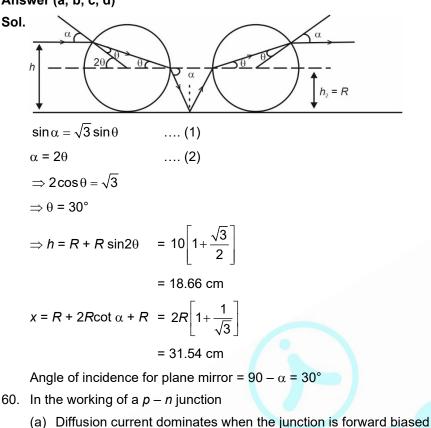

58. In an experiment with Lummer Gehrcke plate, the two coherent beams of light, caused by multiple reflections inside the transparent plate of refractive index μ = 1.54, reach the points *P* and *Q* on the screen. The net path difference between the two beams reaching either at *P* or *Q* is Δx = 5000 nm. Which of the wavelengths in the visible range (λ = 390 nm to λ = 780 nm) is/are most likely to produce a constructive interference (a maximum) at the point *P* as well as at *Q* on the screen?

- 59. Two identical transparent solid cylinders, each of radius 10 cm and refractive index $\mu = \sqrt{3}$, lie horizontally parallel to each other on a horizontal plane mirror with a separation *x* between their horizontal axes. A ray of light is incident horizontally on the cylinder A at a height *h* above the plane mirror so as to emerge from this cylinder at a height $h_1 = 0.1$ m above the plane mirror. The ray emerging out from the first cylinder *A* is reflected from the horizontal plane mirror to enter the second parallel cylinder *B* at a height h_2 and then this ray emerges out of the second cylinder, parallel and in-line with the original incident ray. The correct statement(s) is/are:
 - (a) The height *h* above the plane mirror is h = 18.7 cm
 - (b) The ray enters the second cylinder *B* at a height $h_2 = 0.1$ m
 - (c) The separation between the axes of the two cylinders A and B is x = 31.54 cm
 - (d) The angle of incidence on the plane mirror midway between the two cylinders is θ = 30°

Answer (a, b, c, d)

- - (b) Drift current dominates when the junction is reverse biased
 - (c) Depletion region width decreases with increase in forward bias voltage
 - (d) The electric field in the depletion region depends on the number of ionized dopants rather than the dopant density

Answer (a, b, c)

- Sol. (a) Diffusion > drift because of density difference
 - (b) Drift > diffusion because of high electric field
 - (c) Depletion region decrease with increase in forward bias voltage
 - (d) Dopant is not ionized but because of density difference, they diffuse
