Instructions:

- Calculators (in any form) and protractors are not allowed.
- Rulers and compasses are allowed.
- All questions carry equal marks. Maximum marks: 102.
- No marks will be awarded for stating an answer without justification.
- Answer all the questions.
- All questions carry equal marks.
- Answer to each question should start on a new page. Clearly indicate the question number.

1. (a) Let $n \geq 3$ be an integer. Find a configuration of n lines in the plane which has exactly
- $n - 1$ distinct points of intersection;
 - n distinct points of intersection;
- (b) Give configurations of n lines that have exactly $n + 1$ distinct points of intersection for
- $n = 8$ and
 - $n = 9$.

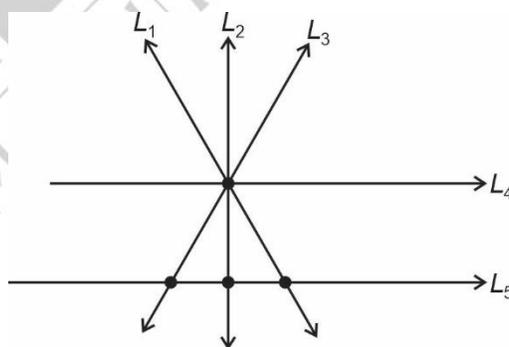

Sol. (a) (i)

There are two possible cases with $(n - 1)$ distinct points of intersection with n lines in a plane as follows

Case-I :

$(n - 1)$ concurrent non coincident line and the n^{th} line is parallel to any one of the concurrent lines.

Example for $n = 5$

Case-II :

Out of n lines $(n - 1)$ lines are parallel to each other and non coincident and the n^{th} line is not parallel to $(n - 1)$ set of parallel lines.

For example $n = 5$

(ii)

For n distinct point of intersection made by n distinct lines in a plane $(n - 1)$ lines must be concurrent and the n^{th} should not be parallel to any of the $(n - 1)$ concurrent lines. For example, $n = 4$

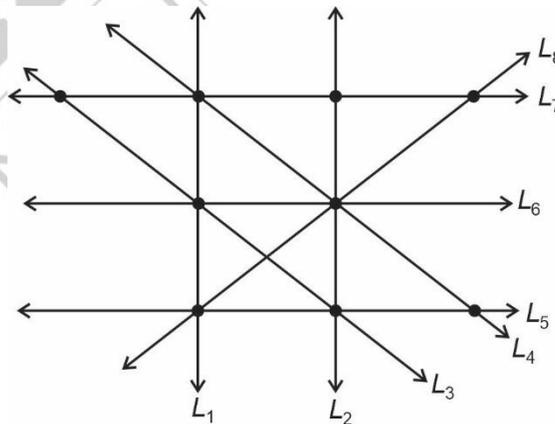

(b)

For n lines in a plane, total number of possible point of intersection is nC_2 . To make number of point of intersection less, we have to take set of parallel lines and concurrent lines.

(i)

For $n = 8$, if we take 3 set of parallel lines where exactly 3 lines are parallel to each other exactly 2 lines are parallel to each other and other two lines are parallel to each other and 8th line has 3 points of concurrency as follows :

(ii)

For $n = 9$, there are 3 set of parallel lines, where exactly 2 lines are parallel to each other, other 2 lines are parallel to each other, other 2 lines are parallel to each other. Remaining 3 lines are concurrent with these parallel lines as follows :

2. Let a, b, c be distinct nonzero real numbers satisfying

$$a + \frac{2}{b} = b + \frac{2}{c} = c + \frac{2}{a}$$

Determine the value of $|a^2b + b^2c + c^2a|$.

Sol. $(6\sqrt{2})$

$$a + \frac{2}{b} = b + \frac{2}{c} = c + \frac{2}{a} = k$$

$$\begin{array}{l} a - b = \frac{2}{c} - \frac{2}{b} \\ a - b = \frac{2(b-c)}{bc} \\ abc - b^2c = 2(b-c) \end{array} \quad \begin{array}{l} b - c = \frac{2}{a} - \frac{2}{c} \\ b - c = \frac{2(c-a)}{ac} \\ abc - c^2a = 2(c-a) \end{array} \quad \begin{array}{l} a - c = \frac{2}{a} - \frac{2}{b} \\ a - c = \frac{2(b-a)}{ab} \\ a^2b - abc = 2(b-a) \\ abc - a^2b = 2(a-b) \end{array}$$

$$3abc - (a^2b + b^2c + ca) = 0$$

$$a^2b + b^2c + c^2a = 3abc$$

$$(a - b) = \frac{2(b - c)}{bc}$$

$$(b - c) = \frac{2(c - a)}{ac}$$

$$(c-a) = \frac{2(a-b)}{ab}$$

$$\begin{aligned} & (a-b)(b-c)(c-a) \\ &= \frac{8(a-b)(b-c)(c-a)}{a^2b^2c^2} \end{aligned}$$

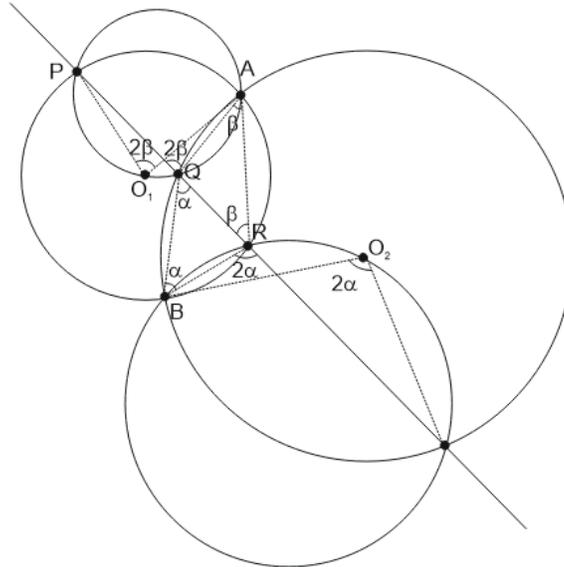

$$(abc)^2 = 8$$

$$abc = \pm 2\sqrt{2}$$

$$|a^2b + b^2c + c^2a| = 3 \times 2\sqrt{2} = 6\sqrt{2}$$

3. Let Ω and Γ be circles centred at O_1, O_2 respectively. Suppose that they intersect in distinct points A, B . Suppose O_1 is outside Γ and O_2 is outside Ω . Let l be a line not passing through A and B that intersects Ω at P, R and Γ at Q, S so that P, Q, R, S lie on the line in this order. Furthermore, the points O_1, B lie on one side of the l and the points O_2, A lie on the other side of l . Given that the points A, P, Q, O_1 are concyclic and B, R, S, O_2 are concyclic as well, prove that $AQ = BR$.

Sol.

Let $\angle SQB = \alpha$

$\Rightarrow \angle SO_2B = 2\alpha$

Now $\angle BRS = \angle SO_2B = 2\alpha$ [as B, R, S, O_2 are concyclic]

Now, In $\triangle BRS$

In RMO 2024

$$\angle BRS = \angle SQB + \angle QBR \text{ [exterior angle theorem]}$$

$$\Rightarrow \angle QBR = 2\alpha - \alpha$$

$$\angle QBR = \alpha$$

\therefore In $\triangle BRS$

$$\angle QBR = \angle BQR = \alpha$$

$$\Rightarrow QR = BR \quad \dots \text{ (i)}$$

Now let $\angle PRA = \beta$

$$\Rightarrow \angle PO_1 A = 2\beta$$

Now $\angle PQA = \angle PO_1 A = 2\beta$ [as P, O_1, Q, A are concyclic]

Now In $\triangle QAR$

$$\angle PQA = \angle PRA + \angle QAR \text{ [exterior angle theorem]}$$

$$\Rightarrow \angle QAR = \beta$$

\therefore In $\triangle QAR$

$$\angle QAR = \angle QRA = \beta$$

$$\Rightarrow AQ = QR \quad \dots \text{ (ii)}$$

From (i) and (ii)

$$AQ = BR$$

Hence proved

4. Prove that there do not exist positive rational numbers x and y such that $x + y + \frac{1}{x} + \frac{1}{y} = 2025$

Sol. $\left(x + \frac{1}{x}\right) + \left(y + \frac{1}{y}\right) = 2025$

Let $x = \frac{a}{b}, y = \frac{c}{d}$ $\begin{cases} \gcd(a, b) = 1 \\ \gcd(c, d) = 1 \end{cases}$

$$\Rightarrow \frac{a^2 + b^2}{ab} + \frac{c^2 + d^2}{cd} = 2025$$

$$\Rightarrow cd(a^2 + b^2) + ab(c^2 + d^2) = 2025abcd$$

lemma 1: If $\gcd(x, y) = 1$

$$\Rightarrow \gcd(xy, x^2 + y^2) = 1$$

Let $\gcd(xy, x^2 + y^2) = d$

If $d > 1$, let p be a prime such that $p \mid d$

$$\Rightarrow p \mid xy, p \mid x^2 + y^2$$

$$\Rightarrow p \mid x \text{ or } p \mid y \text{ as } \gcd(x, y) = 1$$

If $p \mid x$

$$\Rightarrow P \mid x^2 + y^2$$

$\Rightarrow P \mid y^2$ again contradiction as $\gcd(x, y) = 1 \Rightarrow d = 1$

$$\Rightarrow cd(a^2 + b^2) \equiv 0 \pmod{ab}$$

$\Rightarrow cd \equiv 0 \pmod{ab}$ due to lemma 1

$\Rightarrow ab \mid cd$, similarly $cd \mid ab$ by taking cd

$$cd \mid (c^2 + d^2)ab$$

$$\Rightarrow |ab| = |cd|$$

Since $x, y \in \mathbb{R}^+$

$$\Rightarrow ab = cd$$

Let $a = mp$

$$b = nq$$

$$c = mq, d = rp$$

such that $ab = cd$ & $\gcd(a, b) = 1, \gcd(c, d) = 1$

for m, n, p, q relatively coprimes.

$$\Rightarrow (a^2 + b^2) + (c^2 + d^2) = (m^2 + n^2)(p^2 + q^2)$$

$$= 2025 mnpq$$

$$\Rightarrow (p^2 + q^2) \mid 2025 mnpq$$

Due to lemma 1

$$(p^2 + q^2) \mid 2025 mn$$

Since p, q, m, n are relatively prime $\Rightarrow \gcd(p^2 + q^2, mn) = 1$

$$\Rightarrow (p^2 + q^2) \mid 2025 = 3^4 \cdot 5^2$$

$$\text{and } (m^2 + n^2) \mid 2025 = 3^4 \cdot 5^2$$

lemma 2 : If $3 \mid (x^2 + y^2)$

$$\Rightarrow 3 \mid x \text{ \& \ } 3 \mid y$$

If $\gcd(x, y) = 1$

Then $3 \nmid (x^2 + y^2)$

Due to lemma 2:

$$p^2 + q^2 \mid 25 \text{ \& \ } m^2 + n^2 \mid 25$$

$$\Rightarrow p^2 + q^2 = 5 \text{ or } 25, (m^2 + n^2) = 5 \text{ or } 25$$

$$\Rightarrow (p^2 + q^2) \leq 25, m^2 + n^2 \leq 25$$

In RMO 2024

$$\Rightarrow (p^2 + q^2)(m^2 + n^2) \leq 625$$

but $2025 mnpq \geq 2025$

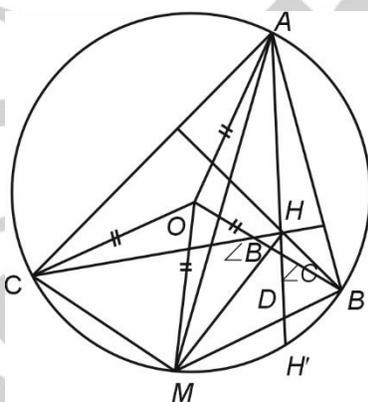

\Rightarrow no such p, q, m, n exist

\Rightarrow no such a, b, c, d exists

\Rightarrow no such rational numbers x, y exist.

5. Let ABC be an acute-angled triangle with $AB < AC$, orthocentre H and circumcircle Ω . Let M be the midpoint of minor arc BC of Ω . Suppose that MH is equal to the radius of Ω . Prove that $\angle BAC = 60^\circ$.

Sol.

Since, mid point M of arc BC not containing A , chords $MC = MB$ and $OM \perp BC$

$$\Rightarrow \angle CHB = 180^\circ - \angle CAB$$

$$\angle CMB = 180^\circ - \angle CAB$$

Let H' be image of H about the line BC

$$\Rightarrow HH' \perp BC$$

$$\Rightarrow BC \perp HH' \text{ and } BC \perp OM$$

$$\Rightarrow OM \parallel HH'$$

Since BC bisect $HH' \Rightarrow BC$ bisects OM

$$\Rightarrow M \text{ is image of } O \text{ about } BC \Rightarrow \angle COM$$

$$= \angle CMO$$

$$\Rightarrow CO = CM$$

In RMO 2024

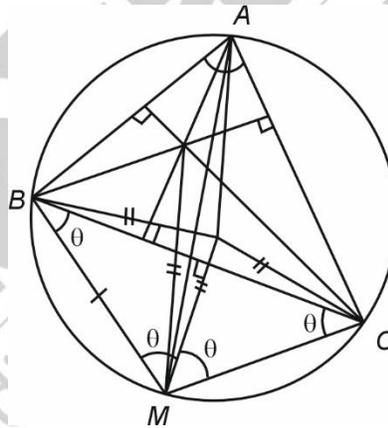

Quadrilateral $MH'HO$ is isosceles trapezium as $BC \perp HH'$ and $OM \perp BC$ and diagonals are equal

$\Rightarrow HH' \parallel OM$ and $OH' = R = MH$

$\Rightarrow BC$ is bisecting both OM and HH'

$\Rightarrow CM = CO$

Now, chasing angles, we get

$$A + 2\theta = 180^\circ$$

\Rightarrow also, $\angle BOC = 2A$

Since $CO = CM \Rightarrow \theta = 60^\circ$

$\Rightarrow \angle BAC = 60^\circ$

6. Let $p(x)$ be a nonconstant polynomial with integer coefficients, and let $n \geq 2$ be an integer such that no term of the sequence $p(0), p(p(0)), p(p(p(0))), \dots$ is divisible by n . Show that there exist integers a, b such that $0 \leq a < b \leq n - 1$ and n divides $p(b) - p(a)$.

Sol. For the contradiction, assume that

$$p(b) \not\equiv p(a) \pmod{n} \quad \forall 0 \leq a < b \leq n - 1$$

⇒ For the $S = \{0, 1, \dots, n-1\}$

$$P(e_1) \not\equiv P(e_2) \pmod{n} \quad \forall e_1, e_2 \in S, e_1 \neq e_2$$

⇒ The set $\{P(0), P(1), \dots, P(n-1)\}$ for the residue system mod n .

Since for polynomial

$$i \equiv j \pmod{n}$$

⇒ $P(i) \not\equiv P(j) \pmod{n}$

⇒ The set $\{P(0), P(1), \dots, P(n-1)\}$ and residue set $\{0, 1, \dots, n-1\}$ will be a one-one, onto function

⇒ Bijection function

Defined $q^k(0) = q^{k-1}(0)$, $q^2(0) = q(q(0))$

Such that $q(x) = P(x) \pmod{n}$

Such that $g: \{0, 1, \dots, n-1\} \rightarrow \{0, 1, \dots, n-1\}$

⇒ Since $n \nmid P(0), p(p(0)) \dots p \dots (p)(0) \dots$

Now if none of $q^k(0) \neq 0$, then there will be n pigeons but $(n-1)$ holes

⇒ $q^l(0) = q^m(0)$ for some $l, m \in (1, 2, \dots, n-1)$

⇒ since $q(x)$ is one-one

⇒ $q^{l-m}(0) = q^{m-l}(0)$

⇒ Similarly

$$q^{-l} = q^{m-1}(0), \text{ for } l < m$$

⇒ $q^0(0) = q^{m-1}(0)$ and that is contradiction

⇒ $q^k(0) = 0$ and that means

$$P^k(0) = P(P \dots k \text{ times})(0) = 0$$

And that is contradiction

⇒ $P(a) \equiv P(b) \pmod{n}$

⇒ $n \mid P(a) - P(b)$
